Keynote: Energy Use in Information and Communications Technologies: The Role of Thermal Management

Data centers account for a significant and growing fraction of the worldwide electricity demand, owing to the rapid proliferation of electronics devices and associated digital data generation. Despite this rapid growth in total energy consumption, the largely ad hoc approaches to space conditioning in large data centers and server farms have led to unconscionable inefficiencies that are driving information technology companies to lower their overall energy footprint. The sheer magnitude of heat dissipation in these large-scale computing facilities is staggering, and calls for urgent improvement of data center cooling strategies, which consume a significant fraction of the total energy used at the facility level. In particular, technologies that allow for increases in the data center operating temperature have the potential to eliminate energy-intensive air-conditioning systems and enable year-round rejection of waste heat to the ambient. Liquid cooling offers a low-thermal-resistance thermal transport mechanism that may enable such operation without increasing the temperature of the electronic devices. Embedding liquid coolant channels directly in electronic devices offers further potential improvement in efficiency and performance scaling by enabling dramatic changes in the system architecture, such as 3D chip stacking. This talk will review key challenges encountered in the thermal management of information technology equipment at different scales, from data centers down to small-scale portable electronics, as well as recent technological developments related to embedded liquid-cooling strategies that may enable significant energy savings and performance gains.

Keynote: East Asia Energy Policy: Research & Outlook

Due to increases in population and sustained industrialization, urbanization and motorization that come with economic growth, the East Asian region is estimated to double its primary energy demand between 2013 and 2040. This increase in energy demand has implications on countries' energy security and efforts in mitigating climate change. There is a need to rapidly develop and deploy energy efficient technologies, phase-out the use of fossil fuel in the power generation sectors and proactively increase the share of renewables in the energy mix. In view of this, it is important to understand the future trajectory of energy demand growth with respect to economic development, future energy choice, and the subsequent investment requirements and research needs to better prepare for the future.

Keynote: Closed Carbon Cycle Economy

In 2015, the delegates at COP 21 in Paris expressed the political will to effectively mitigate climate change, but society still has a long way to go to rid itself of CO₂ emissions. How to accomplish this task? In the long term, problems due to anthropogenic greenhouse gas emissions can only be resolved by restructuring entire social and economic systems to employ closed carbon cycles. Carbon utilization is unavoidable but its net impact on the environment can be minimized through holistic consideration of cyclic processes that offer opportunities to offset emissions. Beyond designing new technologies lies the even broader idea of a closed carbon cycle economy. This approach integrates the technical and social aspects of long-term transitions from current structures for supplying society with power, fuel, and resources to those based on closed carbon cycles. This leads to a large number of fundamental and application-oriented challenges relating to engineering and natural sciences, whilst raising just as many questions in the fields of humanities and social sciences.

In 2015, the Closed Carbon Cycle Economy Research Department was founded at Ruhr-University Bochum. Researchers from the fields of engineering, natural sciences, humanities and social sciences collaborate in an interdisciplinary environment. Based on experiences from German efforts to mitigate climate change, the lecture will address lessons learned, visions for future developments, and – most importantly – the need for interdisciplinary cooperation.

Bio

Prof. Roland Span studied mechanical engineering at Ruhr-University Bochum (RUB) from 1983 to 1988. In 1992, he completed his Ph.D. with a thesis introducing a new reference equation of state for carbon dioxide. His work was supervised by Prof. W. Wagner. In 1999, he completed his habilitation with a thesis entitled “Multiparameter Equations of State – An Accurate Source of Thermodynamic Property Data”. At ALSTOM Power Technologies in Switzerland, he worked on gas-turbine related topics, including humidified gas-turbines and CCS. In 2002, he became chair of Thermodynamics and Energy Technologies at University of Paderborn. In 2006, he changed to RUB, where he is chair of Thermodynamics, leading an institute with about 25 scientific co-workers and 25 student co-workers. Prof. Span has published highly cited scientific papers dealing mostly with experimental and theoretical work on thermodynamic properties and the application of corresponding models to process simulations in energy technologies. He is member of several scientific committees, including editorial boards and working groups of international unions like IAPWS. He is dean of the faculty of mechanical engineering, one of three speakers of the Research Department Closed Carbon Cycle Economy at RUB and member of the European Academy of Sciences and Arts.

Energy Systems Modelling: From Theory to Application

08:10-09:50

Calon 1

The rapid transformation of energy systems is taking place in order to address the so-called energy trilemma, which refers to improving security of supply, reducing emissions and ensuring that energy is affordable for consumers. Due to the complex nature of energy systems, and the interdependencies that exist between different energy vectors within energy systems, it is increasingly challenging to find cost-effective pathways to address the energy trilemma.

In order to unpack these complexities and better understand efficacy of decisions made in energy systems, numerous computer models were developed and yet new modelling tools are being produced to assist with studying the energy systems. The focus of this panel will be on different modelling approaches for studying various aspects of energy systems. The panelists will talk about specific modelling approaches and discuss a case study in which their proposed approaches were applied.

Day 2

Ammonia for Power

13:40-15:20

Calon 1

A potential enabler of a low carbon economy is the energy vector hydrogen. However, issues associated with hydrogen storage and distribution are currently a barrier for its implementation. Hence, other indirect storage media such as ammonia and methanol can be considered. Of these, ammonia is a carbon free carrier which offers high energy density, even higher than compressed air and similar to some hydrocarbons. Hence, it is proposed that ammonia, with its established transportation network and high flexibility, could provide a practical next generation system for energy transportation, storage and use for power generation. Therefore, this panel will focus on discussions based on state of the art projects running across the world to enable ammonia as a fluid for power generation.

Chair: Dr. Agustin Valera Medina

Participants: Prof. Jim Kok (University of Twente, Netherlands), Prof. Edman Tsang (University of Oxford, UK); Dr. Zhaolin Wang (University of Xiamen, China); Prof. Gldeon Grader (Techion, Israel); Prof. Arif Karabeyoglu (Koc University, Turkey)

Day 2

Scientific Publication

15:50-17:30

Calon 1

The goal of this panel session is to provide background information on academic publishing. It outlines the various important steps that an author needs to follow in preparing his manuscript for a successful publication in an international journal. This presentation will also give you an overview of the publishing market and ethics.

What is GTRC?

In 2004, Cardiff University was selected by QinetiQ ahead of other UK consortia to take ownership of their large-scale gas turbine combustion research facility. GTRC was launched in 2007 with the support from the European Union and the Welsh Assembly Government.

GTRC enables novel large-scale research studies to be conducted into the functionality of new Gas Turbine (GT) combustion systems, components and fuels under elevated conditions of temperature and pressure, as would be experienced within a gas turbine engine during operation.

An extensive suite of bespoke test rigs are available for the characterisation of combustion and fuel systems utilising traditional as well as alternative and renewable fuels, or fuel mixtures using a multi-component gas mixing facility. An extensive suite of non-intrusive measurement techniques enable fundamental investigations of phenomena occurring within the combustion system, giving rise to poor operational or emission performance. Exhaust gas samples are conditioned and transported to a comprehensive on-line gas analysis suite, including the European reference systems for particulate matter measurement.

The currently UK research council funded GTRC research programmes focus on the following applied energy challenges : Fuel and operational flexibility; complementing intermittent renewables; chemical energy storage via hydrogen and derivatives such as ammonia; Carbon Capture and Storage/Utilisation (CCS/U) strategies, including oxyfuel and selective exhaust gas recirculation; risk and hazard management including PM emissions and explosion hazards. As part of regional development

funding, some of these research themes are being developed into demonstration projects. All GTRC projects are sponsored by or in collaboration with industry, including Siemens, Rolls-Royce, Uniper, RWE, UK Health and Safety Executive, etc.

What is the Tidal Lagoon Project?

Swansea Bay Tidal Lagoon will be the world's first tidal lagoon power plant. A tidal lagoon is a 'U' shaped breakwater, built out from the coast which contains a bank of hydro turbines. Water fills up and empties the man-made lagoon as the tides rise and fall. Electricity is generated on both the incoming and outgoing tides, four times a day, every day.

Due to the incredible tides on the West Coast of Britain, by keeping the turbine gates shut for just three hours, there is already a 14ft height difference in water between the inside and the outside of the lagoon. Power is then generated as the water rushes through 200ft long draft tubes, rotating the 23ft diameter hydro turbines.

The project was awarded a Development Consent Order in 2015 and is primed for construction. It will comprise 16 hydro turbines, a six mile breakwater wall, generating electricity for 155,000 homes for the next 120 years.

Its major delivery partners include Atkins, General Electric, Andritz Hydro, Laing O'Rourke and Alun Griffiths Ltd. To know more about it go to <http://www.tidallagoonpower.com/about/>

About The SOLCER 'Energy Positive' House

Energy efficient design means more energy for the national grid. Experts from Cardiff University have designed and built the UK's first purpose-built, low-cost energy smart house, capable of exporting more energy to the national electricity grid than it uses. The house (see photo below), designed by Professor Phil Jones and his team based at the Welsh School of Architecture, has been built as a prototype to meet tough targets for zero carbon housing set by UK Government.

SOLCER house. Source: Cardiff University

Designed and constructed as part of the Wales Low Carbon Research Institute's (LCRI) SOLCER project, and supported by SPECIFIC at Swansea University, its unique design combines for the first time reduced energy demand, renewable energy supply and energy storage to create an energy positive house.

Cardiff Bay

Cardiff owes much of its history to the Industrial Revolution of the 1790's, which stimulated mining in the valleys of South Wales. By the 1880's, Cardiff had transformed from one of the smallest towns in Wales to the largest and its port was handling more coal than any other port in the world. On the eve of the First World War in 1913, coal exports reached their peak at over 13 million tonnes. At this time the international price of coal was struck in the Coal Exchange building and it was here that the world's first £1 million pound deal was signed.

After the Second World War, however, demand for coal slumped and international markets were lost as other countries developed their own steel industries. Trade was increasingly lost to container ports and by the 1960's coal exports had virtually ceased. In 1978 East Moors Steelworks closed with the loss of 3,200 jobs and this dealt a further blow to South Cardiff. Today, the Cardiff docklands area is known as Cardiff Bay and it has been transformed by the Cardiff Barrage that impounds the Rivers Taff and the Ely to create a massive fresh-water lake. A number of boat tours operate from Mermaid Quay, which allow you to gain an understanding of the history and fauna of this exciting and upcoming area. There is also a water taxi service which operates throughout the year from the Bay to the city centre and Penarth.

Cardiff Bay is home to a number of attractions such as Techniquest Science Discovery Centre ideal for all the family, Craft in the Bay, The Welsh Assembly at the Pierhead, Butetown History and Arts Centre, the Norwegian Church Arts Centre and the Wales Millennium Centre, a stunning international arts centre. The Red Dragon Centre provides further options for family entertainment.

Cardiff is easily accessible via the M4 motorway, which runs through the north of the city, making London a comfortable drive away. From the Midlands, the North of England and Scotland it is a straightforward drive via the M6, M5 and M50/M4. From the South and South West of England the approach is by M5 and M4. Access from West Wales is by M4.

BY COACH

Cardiff bus station is located adjacent to Cardiff Central Station and is the central hub for buses and coaches arriving from outside Cardiff. You can travel to Cardiff by National Express Coach from most UK cities. There are also Megabus routes into Cardiff from London, Swansea, Birmingham Airport, Manchester and Newcastle. The Megabus stops at Kingsway, just opposite the Hilton Hotel.
